

One transition. Three generators. An encoder that connects them.

Implemented model • encoder_shared_state • MoG: 1,024 particles • no trajectories

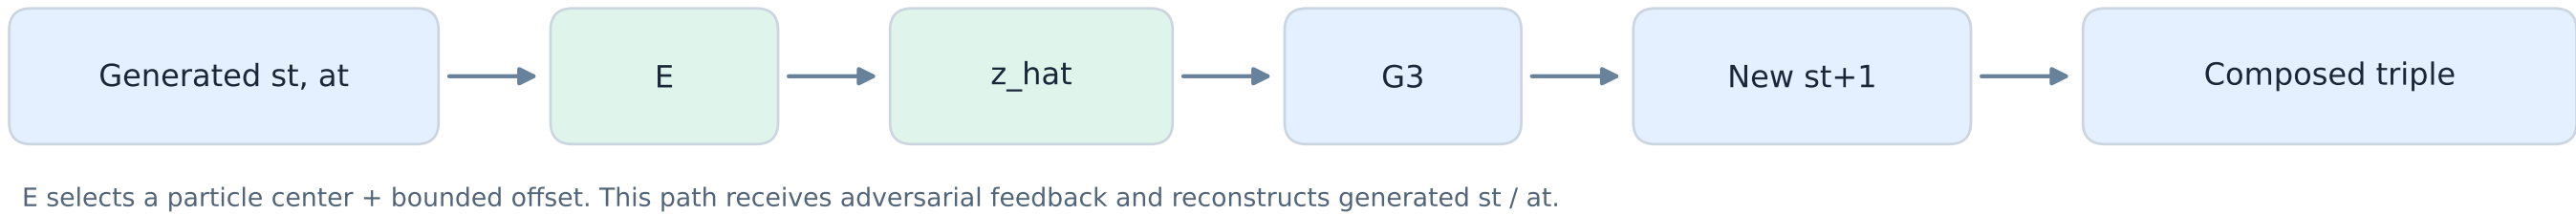

1 ORIGINAL SAMPLING

All three independent generators receive the same sampled center AND Gaussian noise.

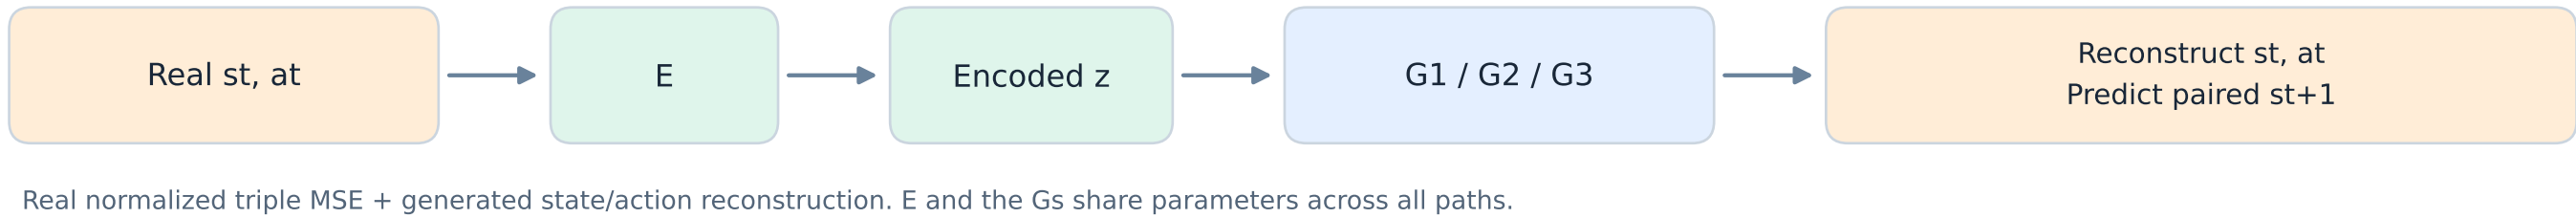

2 SYNTHETIC COMPOSITION

Keep st and at from G1/G2; produce a new next state through the encoder.

3 LEARNING FROM REAL TRANSITIONS

E sees real st and at. The paired real st+1 is a training target, never an encoder input.

4 ADVERSARIAL FEEDBACK

Three networks • four input roles
